

CPP Filter has been in business since the early 1980's and has provided single source filtration solutions to many customers in various industrial applications over the years.

CPP Filter, formerly Central Power Products, was located in rural Brookston Indiana until the year 2000. It was then that Central Power Products was acquired by its current owners, name changed to CPP Filter and the business moved to Lafayette, Indiana.

Initially, Central Power Products not only provided filtration replacement solutions, but also various air and hydraulic process fittings. It was during these early years that the need for establishing a provider of various types of filtration replacement products was recognized.

There have always been various manufacturers who excel in 1 or 2 product areas of filtration, but none who could offer a full line of products providing top quality and the latest technological offerings on the market from one company.

Over the years, CPP has partnered with some of the leading manufacturers of industrial filtration products available. These relationships have given CPP the opportunity to offer some of the most reliable and technologically advanced products on the market today.
